QFT Replay Simulator 3.05

What's new – replay up to 4 symbols at the same time, smoother Prev Bar, clearer messages

© Qazi Forex Tips | qaziforextips.com | WhatsApp +92-323-6700010 | MT5 and MT4

Version 3.05 lets you practise the way professionals read the market: **more than one chart moving together**. Replay Gold with the Dollar Index, EURUSD with GBPUSD, or any pair with its correlated partner – every chart shows the **same second** of the past, and you can trade all of them from one panel.

1. Extra symbols – up to 3 more

NEW

Choose up to 3 extra pairs in New Simulation. They replay together with the main symbol, each on its own chart.

2. Trade every symbol

NEW

A symbol list next to Buy / Sell. It follows the chart in front – click a chart and trade that pair.

3. Download missing data – one click

NEW

The simulator checks every extra pair and downloads what is missing, one after the other.

4. Clear status for every pair

NEW

Ready, no data, data starts later / ends earlier – with the dates. Mouse over = full details.

5. Smoother Prev Bar

BETTER

Going back one candle is one clean step – no more jump back and forth on the charts.

6. Clearer messages at the start

BETTER

"Allow DLL imports" off, two simulators in one MetaTrader, the same pair twice – you now get a clear message.

Nothing is lost when you update

Your license, downloaded data, saved simulations (also ones with a challenge), templates and settings stay exactly as they are. Old saved simulations open normally in 3.05.

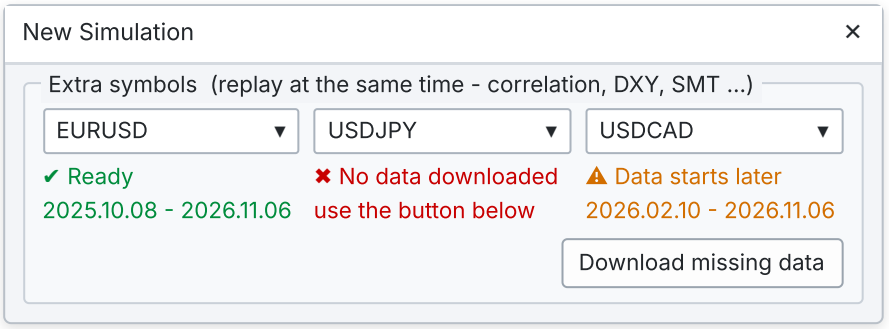
1 Extra symbols – replay up to 4 symbols together

Correlation, Dollar Index (DXY), SMT divergence – all at the same moment of the past

Until 3.04 a simulation had one symbol. Many strategies need a second chart: Gold traders watch the Dollar, ICT/SMC traders compare EURUSD with GBPUSD (SMT divergence), index traders compare NAS100 with US500. In 3.05 you choose up to **3 extra symbols**. When you press Next Bar, Play, Real-time, Go to or Prev Bar, **every chart moves to the same second**.

Choose the extra symbols

1. Main Menu → **New simulation**. Choose the main symbol and the start date as usual.
2. In **Extra symbols** open a list: it shows **every symbol of your Market Watch** and every symbol you have already downloaded. Choose up to three. **(none)** = not used.
3. Under each list you see its **status** (table below). Move the mouse over it for the full details.
4. Press **Start simulation**. Every extra symbol opens its own chart (first timeframe of your list – you can change it on the chart).



The Extra symbols part of the New Simulation window (MT5 and MT4).

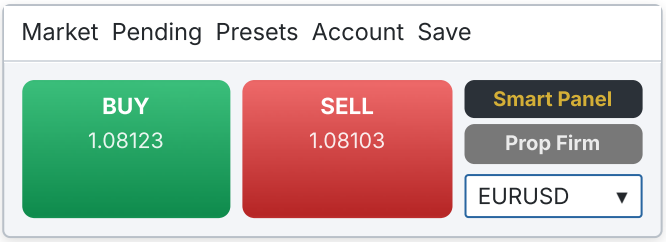
Status under the list	Meaning	What to do
✔ **Ready** + dates	Data covers your start date. The second line shows the first and last day of the data.	Nothing – just start.
✖ **No data downloaded**	This pair has no data on your computer yet.	Press **Download missing data**.
⚠ **Data starts later / ends earlier**	Data exists, but your start date is before its first day or after its last day.	Download missing data, or change the start date.
⚠ **Chosen twice**	The same pair is in two lists.	Choose another pair.
Same as the main symbol	The extra list has the main symbol.	Choose another pair.

If you press Start while a pair still has a problem, a message lists every pair and the reason – the simulation does not start with missing data.

> **Trader's tip – SMT divergence**
>
> Replay EURUSD as the main symbol and GBPUSD as an extra symbol on M15. When EURUSD makes a lower low but GBPUSD does not, institutions are often buying – wait for your entry signal on EURUSD. Practise this 20–30 times in the simulator before you trust it live.

2 Trade every symbol from one panel

The panel follows the chart you are looking at



The new symbol list under Prop Firm (Market tab). Buy / Sell / pending orders go to this symbol.

- **Click a replay chart** – the symbol list switches to that chart's pair by itself. Or choose the pair in the list.
- Lot, SL and TP (pips or price, risk % or risk USD) are calculated for **the chosen pair** – with its own pip size and price.
- Order lines, SL / TP lines and Visual Mode are drawn only on the charts of **that** pair.
- **Close All** on the panel closes the trades of the chosen pair. **Close All** in the Trades window closes everything.
- The Trades window shows all trades of all pairs. Equity, floating P/L and the **Prop Firm Challenge** count every pair together – like one real account.
- The report has a new table **Result per symbol**: closed orders, win rate, net profit, profit factor and total R for every pair.
- **Save / Load** keeps the extra symbols and their trades.
- When the downloaded data of an extra pair ends, only that chart stops; the others go on.

3 Download missing data – one click

No need to open Data Center for every pair

1. In New Simulation a pair shows ✖ or ⚠ → the button **Download missing data** appears.
2. Click it. The pairs are downloaded one after the other (M1 candles – fast, every broker has them; the replay creates the ticks). The line under the lists shows the progress, for example *Downloading USDJPY (2 of 3): 25 / 160 days*.
3. The pair being downloaded shows ⏳ **Downloading ...**, the others ⏳ **Waiting ...**. When it is finished the status turns to ✔ **Ready**.

- The dates are the same as your main symbol: the history days before the start and up to the last day of the main symbol.
- The button becomes **Stop download** while it runs. Days that are already saved are kept.
- If the broker simply has no more data (for example a status still says *Data ends earlier* after the download), choose another pair or another start date – mouse over the status shows the exact dates.

4 Smoother Prev Bar

One clean step back

In Bar Start mode, Prev Bar first removed the candle and then built its first tick again – for a moment the charts jumped one candle too far back and then forward again. In 3.05 the candle is replaced in one step: the charts (also the extra symbols) simply move one candle back.

5 Clearer messages at the start

You always know what is wrong – and how to fix it

Situation	Before 3.05	Now
"Allow DLL imports" not ticked	Nothing happened – no window, no message.	A message explains where to tick **Allow DLL imports** (Common / Dependencies tab, and Tools → Options if it is off for all programs).
The simulator on **two charts** of the same MetaTrader	Both shared one window – clicks went to the wrong copy.	The second copy shows "*already running on the EURUSD chart*" and stops. Use that chart or remove it there first.
The **same pair twice** in Extra symbols	Not checked.	⚠ Chosen twice – choose another pair.

> **Professional trader's view**
>
> Correlation is a filter, not an entry signal. Use the extra charts to **confirm** what you see on your main symbol (Dollar strength for Gold, the sister pair for SMT) and keep your entry rules on the main chart. Note in your journal whether the extra chart agreed – after 50 trades the report shows you if the filter really helps.

How to get version 3.05

1. Attach the simulator as usual. In the Main Menu the button **Update 3.05** appears (or open **Updates**).
2. Click **Update now**. The new simulator **and** the new `QFTSimUI.dll` are installed. When it says **UPDATE INSTALLED**, close MetaTrader completely and start it again.
3. Check: the Main Menu shows **Version 3.05**, and New Simulation has the part **Extra symbols**.

> **Extra symbols are missing after the update?**
>
> MetaTrader still uses the old DLL or an old copy of the simulator: close MetaTrader completely (also from the taskbar) and start it again. Run the simulator on **one** chart only.
